CLINICAL BIOCHEMISTRY

Test Name	Results	Units	Ref. Range	Method
BILE ACIDS TOTAL-SERUM	9.6	µmol/L	0.50-10.00	Enzymatic Colorimetric

Interpretation:

Total bile acids are metabolized in the liver and can serve as a marker for normal liver function. Increases in serum bile acids are seen in patients with acute hepatitis, chronic hepatitis, liver sclerosis, liver cancer, and intrahepatic cholestasis of pregnancy. In Obstetric Cholestasis, concentrations greater than 15 µmol/L usually confirms the diagnosis in the absence of other hepatic disease. Bile acid concentrations greater than 40 µmol/L have been associated with increased fetal risk.

Correlate Clinically.
