| CLINICAL BIOCHEMISTRY | | | | |
|---|---------|--------|-------------------------|--------|
| Test Name | Results | Units | Ref. Range | Method |
| Beta- Human Chorionic Gonodotropin Hormone | 0.37 | mIU/mL | Refer to Interpretation | CLIA |

Interpretation:

- A quantitative human chorionic gonadotropin (HCG) test measures the specific level of HCG in the blood. HCG is a hormone produced in the body during pregnancy.
- HCG appears in the blood and urine of pregnant women as early as 10 days after conception. Quantitative HCG measurement helps determine the exact age of the fetus. It can also assist in the diagnosis of abnormal pregnancies, such as ectopic pregnancies, molar pregnancies, and possible miscarriages. It is also used as part of a screening test for Down syndrome.
- This test is also done to diagnose abnormal conditions not related to pregnancy that can raise HCG level.

Non Pregnant Females: < 10.0 mIU/mL Post Menopausal Females: < 10.0 mIU/mL

Pregnancy

| Gestational Age and Expected hCG Values (mIU/mL) | Gestational Age and Expected hCG Values (mIU/mL) | Gestational Age and Expected hCG Values (mIU/mL) |
|---|---|---|
| 0.2-1 weeks: 10-50 | 1-2 weeks : 50-500 | 2-3 weeks : 500-10,000 |
| 3-4 weeks : 1000-50,000 | 5-6 weeks : 10,000-100,000 | 6-8 weeks : 15,000-200,000 |
| 2-3 months : 10,000-100,000 | Excellence in H | ealth Care |

|---------------------------------------|-------------------------------|------------------------------------|
| First Trimester : 81-190 ng/dL | 15 to 40 weeks:9.1-14.0 µg/dL | First Trimester : 0.24-2.99 µIU/mL |
| Second&Third Trimester :100-260 ng/dL | | Second Trimester: 0.46-2.95 µIU/mL |
| | | Third Trimester : 0.43-2.78 µIU/mL |
| Cord Blood: 30-70 ng/dL | Cord Blood: 7.4-13.0 µg/dL | Cord Blood: : 2.3-13.2 µIU/mL |

Interpretation:

• Thyroid gland is a butterfly-shaped endocrine gland that is normally located in the lower front of the neck. The thyroid's job is to make thyroid hormones, which are secreted into the blood and then carried to every tissue in the body. Thyroid hormones help the body use energy, stay warm and keep the brain, heart, muscles, and other organs working as they should.

• Thyroid produces two major hormones: triiodothyronine (T3) and thyroxine (T4). If thyroid gland doesn't produce enough of these hormones, you may experience symptoms such as weight gain, lack of energy, and depression. This condition is called hypothyroidism.

• Thyroid gland produces too many hormones, you may experience weight loss, high levels of anxiety, tremors, and a sense of being on a high. This is called hyperthyroidism.

• TSH interacts with specific cell receptors on the thyroid cell surface and exerts two main actions. The first action is to stimulate cell reproduction and hypertrophy. Secondly, TSH stimulates the thyroid gland to synthesize and secrete T3 and T4.

• The ability to quantitate circulating levels of TSH is important in evaluating thyroid function. It is especially useful in the differential diagnosis of primary (thyroid) from secondary (pituitary) and tertiary (hypothalamus) hypothyroidism. In primary hypothyroidism, TSH levels are significantly elevated, while in secondary and tertiary hypothyroidism, TSH levels are low.

Correlate Clinically.
