HIV 1 & 2 Ab-Chromatography				
HIV - I Results	Reactive		Non Reactive	Immuno Chromatography
HIV-II Results	Non Reactive		Non Reactive	Immunochromatography
HIV-Immunofiltration				
HIV 1	Reactive		Non-reactive	Immunofiltration
HIV 2	Non Reactive		Non Reactive	Immunofiltration
Final Report.				
Final Report-	Tested sample Positive for Hiv-1 antibody			

Interpretation

- Non Reactive result implies that antibodies to HIV 1 / 2 have not been detected in the sample. This means the patient has either not been exposed to HIV 1 / 2 infection or the sample has been tested during the "window phase" i.e. before the development of detectable levels of antibodies. Hence a Non Reactive result does not exclude the possibility of exposure or infection with HIV 1 / 2.
- Pre and Post test counseling to be done by the concerned referring doctor. The sensitivity and specificity of this test has been determined by National HIV Reference Centers of Govt. of India and WHO collaborating Centers, using various other test panels. "
- Reactive samples by ELISA Method are confirmed by 2 other supplemental tests for confirm of HIV infection as per NACO guidelines.
- All patients' reports indeterminate should be repeated with a second sample taken 14 - 28 days. In case the serological results continue to be indeterminate the sample should be subject to western blot for confirmation.

Correlate Clinically.

Result rechecked and verified for abnormal cases
