Erythrocyte Sedimentation Rate (ESR)	18	14 or less	Westergren method
, ,			<b>J</b>

Comments : ESR is an acute phase reactant which indicates presence and intensity of an inflammatory process. It is never diagnostic of a specific disease. It is used to monitor the course or response to treatment of certain diseases. Extremely high levels are found in cases of malignancy, hematologic diseases, collagen disorders and renal diseases.

- Postprandial glucose level is a screening test for Diabetes Mellitus
- If glucose level is >140 mg/dL and <200 mg/dL, then GTT (glucose tolerance test) is advised.
- If level after 2 hours = >200 mg/dL diabetes mellitus is confirmed.
- Advise HbA1c for further evaluation.

Glycated Hemoglobin (HbA1c)	8.7	%	Non Diabetic:< 5.7 Pre diabetic: 5.7-6.4 Diabetic:>= 6.5	HPLC
Mean Plasma Glucose	202.99	mg/dL		Calculated

Ref. Range

**Interpretation:** 

• Glycated hemoglobins (GHb), also called glycohemoglobins, are substances formed when glucose binds to hemoglobin, and occur in amounts proportional to the concentration of serum glucose. Since red blood cells survive an average of 120 days, the measurement of GHb provides an index of a person's average blood glucose concentration (glycemia) during the preceding 2-3 months. Normally, only 4% to 6% of hemoglobin is bound to glucose, while elevated glycohemoglobin levels are seen in diabetes and other hyperglycemic states

Mean Plasma Glucose(MPG): This Is Mathematical Calculations Where Glycated Hb Can Be Correlated With Daily Mean Plasma Glucose Level

CLINICAL BIOCHEMISTRY						
HEALTH PROFILE A-3 PACKAGE						
Test Name	Results	Units	Ref. Range	Method		
25 - Hydroxy Vitamin D	29.87	ng/mL	<20.0-Deficiency 20.0-<30.0-Insufficiency 30.0-100.0-Sufficiency	CLIA		

#### Interpretation:

- Vitamin D helps your body absorb calcium and maintain strong bones throughout your entire life. Your body produces vitamin D when the sun's UV rays contact your skin. Other good sources of the vitamin include fish, eggs, and fortified dairy products. It's also available as a dietary supplement.
- Vitamin D must go through several processes in your body before your body can use it. The first transformation occurs in the liver. Here, your body converts vitamin D to a chemical known as 25-hydroxyvitamin D, also called calcidiol.
- The 25-hydroxy vitamin D test is the best way to monitor vitamin D levels. The amount of 25-hydroxyvitamin D in your blood is a good indication of how much vitamin D your body has. The test can determine if your vitamin D levels are too high or too low.
- .The test is also known as the 25-OH vitamin D test and the calcidiol 25-hydroxycholecalcifoerol test. It can be an important indicator of osteoporosis (bone weakness) and rickets (bone malformation).

#### Those who are at high risk of having low levels of vitamin D include:

- people who don't get much exposure to the sun
- older adults
- people with obesity.
- dietary deficiency

#### **Increased Levels:**

• Vitamin D Intoxication

#### Method : CLIA

Vitamin- B12 (cyanocobalamin)	514	pg/mL	200-911	CLIA	

#### Interpretation:

This test is most often done when other blood tests suggest a condition called megaloblastic anemia. Pernicious anemia is a form of megaloblastic anemia caused by poor vitamin B12 absorption. This can occur when the stomach makes less of the substance the body needs to properly absorb vitamin B12. **Causes of vitamin B12 deficiency include:Diseases that cause malabsorption** 

- Lack of intrinsic factor, a protein that helps the intestine absorb vitamin B12
- Above normal heat production (for example, with hyperthyroidism)

#### An increased vitamin B12 level is uncommon in:

- Liver disease (such as cirrhosis or hepatitis)
- Myeloproliferative disorders (for example, polycythemia vera and chronic myelogenous leukemia)

Result rechecked and verified for abnormal cases

CLINICAL BIOCHEMISTRY						
	HEALTH PROFILE A-3 PACKAGE					
Test Name	Results	Units	Ref. Range	Method		
Kidney Profile-KFT						
Creatinine -Serum	3.2	mg/dL	0.60-1.20	Sarcosine oxidase		
Urea-Serum	79.9	mg/dL	17.1-49.2	Glutamate dehydrogenase+Calculation		
Blood Urea Nitrogen (BUN)	37.34	mg/dL	8.0-23.0	Calculated		
BUN / Creatinine Ratio	11.67		6 - 22			
Uric Acid	3.59	mg/dL	2.6-6.0	Uricase		
Sodium	141	mmol/L	136-145	ISE Direct		
Potassium	4.0	mmol/L	3.5-5.1	ISE Direct		
Chloride	99	mmol/L	98-108	ISE Direct		

Interpretation:

• The kidneys, located in the retroperitoneal space in the abdomen, are vital for patient health. They process several hundred liters of fluid a day and remove around two liters of waste products from the bloodstream. The volume of fluid that passes though the kidneys each minute is closely linked to cardiac output. The kidneys maintain the body's balance of water and concentration of minerals such as sodium, potassium, and phosphorus in blood and remove waste by-products from the blood after digestion, muscle activity and exposure to chemicals or medications. They also produce renin which helps regulate blood pressure, produce erythropoietin which stimulates red blood cell production, and produce an active form of vitamin D, needed for bone health.

Result rechecked and verified for abnormal cases

Globulin	2.5	g/dL	2.0-4.2	Calculated		
A:G Ratio	1.6	%	0.8-2.0	Calculated		
SGOT/SGPT Ratio	1.13					

- Alanine Aminotransferase(ALT) is an enzyme found in liver and kidneys cells. ALT helps create energy for liver cells. Damaged liver cells release ALT into the bloodstream, which can elevate ALT levels in the blood.
- Aspartate Aminotransferase (AST) is an enzyme in the liver and muscles that helps metabolizes amino acids. Similarly to ALT, elevated AST levels may be a sign of liver damage or liver disease.
- Alkaline phosphate (ALP) is an enzyme present in the blood. ALP contributes to numerous vital bodily functions, such as supplying nutrients to the liver, promoting bone growth, and metabolizing fat in the intestines.
- Gamma-glutamyl Transpeptidase (GGTP) is an enzyme that occurs primarily in the liver, but it is also present in the kidneys, pancreas, gallbladder, and spleen. Higher than normal concentrations of GGTP in the blood may indicate alcohol-related liver damage. Elevated GGTP levels can also increase the risk of developing certain types of cancer.
- Bilirubin is a waste product that forms when the liver breaks down red blood cells. Bilirubin exits the body as bile in stool. High levels of bilirubin can cause jaundice a condition in which the skin and whites of the eyes turn yellow- and may indicate liver damage.
- Albumin is a protein that the liver produces. The liver releases albumin into the bloodstream, where it helps fight infections and transport vitamins, hormones, and enzymes throughout the body. Liver damage can cause abnormally low albumin levels.

CLINICAL BIOCHEMISTRY						
HEALTH PROFILE A-3 PACKAGE						
Test Name Results Units Ref. Range Method						
Thyroid Profile-I(TFT)						
T3 (Triiodothyronine)	98.32	ng/dL	40-181	CLIA		
T4 (Thyroxine)	7.5	µg/dL	3.2-12.6	CLIA		
TSH -Thyroid Stimulating Hormone	2.67	µIU/mL	0.35-5.5	CLIA		

Pregnancy	&	Cord	Blood	
-----------	---	------	-------	--

T3 (Triiodothyronine)	:	T4 (Thyroxine)	TSH (Thyroid Stimulating Hormone)
First Trimester	: 81-190 ng/dL	15 to 40 weeks:9.1-14.0 µg/dL	First Trimester : 0.24-2.99 µIU/mL
Second&Third Trimeste	er :100-260 ng/dL		Second Trimester: 0.46-2.95 µIU/mL
			Third Trimester : 0.43-2.78 µIU/mL
Cord Blood: 30-70 ng/c		Cord Blood: 7.4-13.0 µg/dL	Cord Blood: : 2.3-13.2 µIU/mL

Interpretation:

- Thyroid gland is a butterfly-shaped endocrine gland that is normally located in the lower front of the neck. The thyroid's job is to make thyroid hormones, which are secreted into the blood and then carried to every tissue in the body. Thyroid hormones help the body use energy, stay warm and keep the brain, heart, muscles, and other organs working as they should.
- Thyroid produces two major hormones: triiodothyronine (T3) and thyroxine (T4). If thyroid gland doesn't produce enough of these hormones, you may experience symptoms such as weight gain, lack of energy, and depression. This condition is called hypothyroidism.
- Thyroid gland produces too many hormones, you may experience weight loss, high levels of anxiety, tremors, and a sense of being on a high. This is called hyperthyroidism.
- TSH interacts with specific cell receptors on the thyroid cell surface and exerts two main actions. The first action is to stimulate cell reproduction and hypertrophy. Secondly, TSH stimulates the thyroid gland to synthesize and secrete T3 and T4.
- The ability to quantitate circulating levels of TSH is important in evaluating thyroid function. It is especially useful in the differential diagnosis of primary (thyroid) from secondary (pituitary) and tertiary (hypothalamus) hypothyroidism. In primary hypothyroidism, TSH levels are significantly elevated, while in secondary and tertiary hypothyroidism, TSH levels are low.

CLINICAL BIOCHEMISTRY						
HEALTH PROFILE A-3 PACKAGE						
Test Name Results Units Ref. Range Method						
Iron Profile-I						
Iron(Fe)	39	µg/dL	50-170	Ferene		
Total Iron Binding Capacity (TIBC)	468	µg/dL	250-450	Ferene		
Transferrin	327.27	mg/dL	250-380	Calculated		
Iron Saturation((% Transferrin Saturation)	8.33	%	15-50	Calculated		
Unsaturated Iron Binding Capacity (UIBC)	429	ug/dL	110-370	FerroZine		

Interpretation:

• Serum transferrin (and TIBC) high, serum iron low, saturation low. Usual causes of depleted iron stores include blood loss, inadequate dietary iron. RBCs in moderately severe iron deficiency are hypochromic and microcytic. Stainable marrow iron is absent. Serum ferritin decrease is the earliest indicator of iron deficiency if inflammation is absent.

• Anemia of chronic disease: Serum transferrin (and TIBC) low to normal, serum iron low, saturation low or normal. Transferrin decreases with many inflammatory diseases. With chronic disease there is a block in movement to and utilization of iron by marrow. This leads to low serum iron and decreased erythropoiesis. Examples include acute and chronic infections, malignancy and renal failure.

• Sideroblastic Anemia: Serum transferrin (and TIBC) normal to low, serum iron normal to high, saturation high.

• Hemolytic Anemia: Serum transferrin (and TIBC) normal to low, serum iron high, saturation high.

• Hemochromatosis: Serum transferrin (and TIBC) slightly low, serum iron high, saturation very high.

• Protein depletion: Serum transferrin (and TIBC) may be low, serum iron normal or low (if patient also is iron deficient). This may occur as a result of malnutrition, liver disease, renal disease.

• Liver disease: Serum transferrin variable; with acute viral hepatitis, high along with serum iron and ferritin. With chronic liver disease (eg, cirrhosis), transferrin may be low. Patients who have cirrhosis and portacaval shunting have saturated TIBC/transferrin as well as high ferritin.

CLINICAL PATHOLOGY						
HEALTH PROFILE A-3 PACKAGE						
Test Name         Results         Units         Ref. Range         Method						
Complete Urine Analysis (CUE)						
Physical Examination						
Colour	Pale Yellow		Straw to light amber			
Appearance	Clear		Clear			
Chemical Examination						
Glucose	(++)		Negative	Strip Reflectance		
Protein	Absent		Negative	Strip Reflectance		
Bilirubin (Bile)	Negative		Negative	Strip Reflectance		
Urobilinogen	Negative		Negative	Ehrlichs reagent		
Ketone Bodies	Negative		Negative	Strip Reflectance		
Specific Gravity	1.010		1.000 - 1.030	Strip Reflectance		
Blood	Negative		Negative	Strip Reflectance		
Reaction (pH)	6.0		5.0 - 8.5	Reagent strip Reflectance - Double indicator Principle		
Nitrites	Negative		Negative	Strip Reflectance		
Leukocyte esterase	Negative		Negative	Reagent Strip Reflectance		
Microscopic Examination (Microscopy)						
PUS(WBC) Cells	02-04	/hpf	00-05	Microscopy		
R.B.C.	Nil	/hpf	Nil	Microscopic		
Epithelial Cells	01-02	/hpf	00-05	Microscopic		
Casts	Absent		Absent	Microscopic		
Crystals	Absent		Absent	Microscopic		
Bacteria	Nil		Nil			
Budding Yeast Cells	Nil		Absent	Microscopy		
Others	-			Microscopic		

Correlate Clinically.

Result rechecked and verified for abnormal cases Laboratory is NABL Accredited
